ABSTRACT:

A bookmark set is created from search results. First, a search request from a client browser is sent for pages in a distributed database which satisfy a search condition. A set of pages which satisfy the search condition are returned. In the page which presents the search results, each page is associated with a user input sensitive selection means, such as a checkbox. Responsive to user input, i.e. selection of certain pages, a bookmark set comprised of a path to selected pages is created. The created bookmark set is served as a unit to the client browser.
